

**AMENDMENTS TO THE CLAIMS**

Please amend the claims as follows.

1. (Currently Amended) A method for distributing a message from a message administration service to a subscriber receiver[[/]] or decoder of a digital broadcast multimedia network, the method comprising:
  - retrieving a point-to-point communication address for said receiver[[/]] or decoder;
  - transferring a determined message for a determined receiver[[/]] or decoder from the message administration service to a point-to-point communication system that is operatively connected to the receiver[[/]] or decoder and is distinct from the digital broadcast multimedia network, wherein the determined message comprises access rights pertaining to the reception of data by the digital broadcast multimedia network;
  - buffering the determined message in the point-to-point communication system;
  - retrieving, at the determined receiver[[/]] or decoder, the determined message from the point-to-point communication system; and
  - loading the determined message into the receiver[[/]] or decoder and updating the access rights related to the reception of data by the digital broadcast multimedia network.
2. (Previously Presented) The method from claim 1, further comprising:
  - buffering the determined message at an emitter point in the point-to-point communication system corresponding to the message administration service;
  - generating a signal of availability at the receiver, triggering for emission of the determined message; and
  - upon reception of the signal of availability, emitting the determined message to the receiver.
3. (Previously Presented) The method according to claim 1, further comprising:
  - receiving the determined message at the receiver; and
  - buffering the determined message at the receiver.
4. (Previously Presented) The method according to claim 1, further comprising:

generating a confirmation of receipt at the receiver; and  
emitting the confirmation of receipt to an emitter point.

5. (Currently Amended) The method according to claim 4, in which the confirmation of receipt comprises at least one of a plurality of items of additional information selected from the group consisting of a status of the receiver or decoder, a status of a daughter smartcard used with the receiver or decoder, and a version number of an element of the receiver or decoder.
6. (Currently Amended) The method according to claim 5, further comprising:
  - extracting the at least one item of additional information from the confirmation of receipt; and
  - evaluating the at least one item of additional information to determine a legal status of the receiver or decoder.
7. (Previously Presented) The method according to claim 1, in which the point-to-point communication system is a mobile phone network.
8. (Previously Presented) The method according to claim 1, wherein the message administration service is included as part of a Subscriber Authorization System.
9. (Currently Amended) A method for receiving a determined access rights message at a determined subscriber receiver or decoder in a digital broadcast multimedia network, wherein the determined subscriber receiver or decoder is enabled to receive information through a mobile phone communication network distinct from the digital broadcast multimedia network, the method comprising:
  - receiving, in a mobile phone modem of the receiver or decoder, a message containing at least the determined access rights message, wherein the message is specifically addressed to the mobile phone modem;
  - storing at least the access rights message in a storage of the mobile phone modem; and
  - updating access rights related to the reception of data by the digital broadcast multimedia network using the received access rights message.

10. (Currently Amended) The method according to claim 9, further comprising:  
retrieving the access rights message from the storage into the determined receiver[[/]] or decoder.
11. (Currently Amended) A receiver[[/]] or decoder for a digital broadcast multimedia network, the receiver[[/]] or decoder comprising:  
a mobile phone modem operatively connected to the receiver[[/]] or decoder;  
a destination point address uniquely attributed to the mobile phone modem; and  
a storage space in the mobile phone modem to store at least an access rights message, wherein the access rights message comprises access rights for controlling the reception of data in the digital broadcast multimedia network, and wherein the access rights message is retrieved by the receiver[[/]] or decoder from the mobile phone modem.
12. (Currently Amended) The receiver[[/]] or decoder according to claim 11, wherein the mobile phone modem may receive the access rights message from the mobile phone network and store the access rights message independently of a status of the receiver[[/]] or decoder.
13. (Previously Presented) The method according to claim 2, further comprising:  
receiving the determined message at the receiver; and  
buffering the determined message at the receiver.
14. (Previously Presented) The method according to claim 2, further comprising:  
generating a confirmation of receipt at the receiver; and  
emitting the confirmation of receipt to the emitter point.
15. (Previously Presented) The method according to claim 3, further comprising:  
generating a confirmation of receipt at the receiver; and  
emitting the confirmation of receipt to the emitter point.
